

IBMS Architecture

This document provides a whole-project architecture view for the Integrated Business Management Suite (IBMS).

End-to-End System Diagram

Layer Summary

- * Presentation: SPA frontend served through Nginx and connected to backend via HTTPS and WebSocket.
- * API gateway/runtime: FastAPI process in `server.py` exposes REST, GraphQL, analytics, risk, forecast, and AI endpoints.
- * Domain core: Business engines and service modules implement decisioning, risk, compliance, forecasting, and optimization.
- * Security: JWT, RBAC, audit logging, and policy checks enforced in security modules.
- * Async/eventing: Event router and background jobs process webhooks, KPI refresh, compliance checks, and workflow optimization.
- * Data: MongoDB is the primary persistent store; Redis supports caching, queueing, and rate limiting.
- * Deployment: Local containers, Kubernetes manifests, and AWS Terraform templates are all supported.

Source Map

- * Backend runtime: `server.py`
- * Core package: `apps/ibms_core/ibms_core/`
- * Frontend: `frontend/`
- * Deploy assets: `deploy/` and root Docker/NGINX files
